

Lab 2 – Solutions

Exercise 1: Stopping Apache from advertising its server version banner:

Edit the **httpd-default.conf** file in the **C:\xampp\apache\conf\extra** directory.

Look for **ServerTokens Full** and change it to **ServerTokens Prod**

Prod is for Production environment which is the most secure option.

Also, look for **ServerSignature On** and change it to **ServerSignature Off**

Exercise 2: Finding database-related information.

The /includes directory revealed by the robots.txt is the place to look. This can be done by navigating to

<http://192.168.176.133/mutillidae/includes/> and opening the **database-config.inc** file which will include details of the database used in the mutillidae web application:

```
<?php
define('DB_HOST', '127.0.0.1');
define('DB_USERNAME', 'root');
define('DB_PASSWORD', '');
define('DB_NAME', 'mutillidae');
?>
```

Note: if your web browser does not render the file, you can simply right-click the blank page and select “View Page Source”.
